Panorama El Shorouk, El Shorouk, Cairo, Egypt | D.O.B: 15th July. 2002

Education

Misr International University "MIU" Cairo, Egypt

Bachelor of Science in Engineering, Faculty of Electronics and Communications *Sep. 2020 – July 2025*
CUM GPA: 3.95

Experience

CO-Chief of Technical and Academic Sector *OCT.2022 – 2023*

- *IEEE-MIU*

Worked as an instructor for a basic python course for image processing and prepared relevant material from presentations, exercises, and extra resources.

Projects

Simple processor emulation | *Python, PyQt5*

- A simplified design for a microprocessor based on Morris Mano's simple processor, including a logic gate simulation, a unique assembly language and its assembler, and an emulator for the processor packed in an application with the assembler.

Board game with AI | *Python, Pygame, Numpy, C++,*

- An application with an AI scoring different moves of a board game based on heuristics. It uses simple statistical methods to decide the moves which are more likely to win using a depth first search with pruning. The interface is made in python while the algorithm is in c++ for speed.

Logic gate timer | *EDA*

- A stopwatch and timer circuit made using simple logic gates, counters, and registers. The timer has 4 modes, 3 buttons and 3 seven segment displays.

Filter changing through gestures (WIP) | *Python, OpenCV*

- An application that uses simple machine vision to track finger positions, detect certain gestures and use them to apply different filters to the output from the camera.

Image Drawing Replication using RL (WIP) | *Python, Tensorflow, Reinforcement Learning*

- An AI which takes an input image and attempts to recreate it through brush strokes. The final output can be taken as a path with parameters to create a video of the drawing being drawn from scratch. Depending on the training parameters, the AI should be capable of replicating different aspects of drawing from sketching to painting.

Conlang Translation Assistant (WIP) | *Python, Tkinter, Natural Language Processing (NLP)*

- A simple interface that helps with translating to a simple fake language. The language's words are based on a combination of simple words strung together. For a given English word, the interface suggests the closest intermediate words with relevant meaning to the word from the language's words. Once the word meaning has been constructed, it may be translated to the new language.

Technical Skills

Language: Python, C/C++

Frameworks: PyQt5, Tkinter

Developer Tools: VS Code, Visual Studio, Arduino IDE, KICAD, MicrochipStudio

Relevant Coursework: Digital Hub ML Basics, Oxford ML Basics, Tensor flow basics course, Kaggle Courses
